

Organization: Eagl Livelihood Foundation

Website: <https://eagl.in>

Mission

EAGL is a social enterprise which has been working in the areas of livelihood creation, education, healthcare, environment, empowerment of women, and disaster relief.

Context

EAGL was set up in 2017 with a vision of India free of Poverty and hunger with a strategic focus on the economic empowerment of the people at the base of the pyramid. They do this via various programs, example for livelihood generation, they supply poor families with livestock and guidance to make the most of this livestock to generate income. Currently project related data is communicated by ground staff via WhatsApp and collated on Excel.

Challenge

As Eagl is trying to scale up, it is looking to digitize data collection, storage and management and analysis. They need a tracker system for tracking project status, which can also be shared with stakeholders for transparency and audit purposes. They want a solution where project coordinators/managers/admin team based on their entitlement can access or update the data or generate reports. This data should be centrally available to the management.

The data points may vary based on the projects:

- Livelihood Promotion
- Financial Inclusion
- Social Protection
- Social Empowerment

They also need a solution for management of ground level staff like attendance and location tracker to ensure that the said project coordinator is present at the claimed location.

Additional Considerations

Maintaining the integrity of data since many stakeholder will be interacting with the application.

Technology Baseline

1. The NGO has a [website](#) which is only informational in nature
2. The current data collection and management is done via WhatsApp, Google Forms and Excel based solutions
